Viacheslav Munister

Writer, editor and product lead. Long-form journalism, museum curation and the editorial and civic systems that carry them.

munister@outlook.com munister.com.ua eprisjournal.com Europe · remote

PROFILE

Creative director of EPRIS Journal, curator of the EPRIS Museum and a native iOS developer. I write and edit long-form work on architecture, art and cultural memory, and I lead the product side of editorial, educational, commerce and civic systems from discovery to launch. 29 peer-reviewed papers in industrial automation and measurement.

WORK EXPERIENCE

Enterprise Systems Automation Specialist

Apr 2026 – present

LLC Information Technology Solutions · part-time

- Analyse business processes and requirements for ERP and operational automation projects.
- Turn them into solution structures, integration requirements and technical documentation.

Chief Technology Officer

Oct 2025 – present

TeachED · workspace for language teachers

- Own product and technology direction: lesson boards, classroom tools, generated worksheets and more than thirty classroom games.
- Architecture: Node.js and Express API on PostgreSQL, WebSockets for live boards, Stripe billing, a native iOS app; about 90 backend test files.
- Brought AI-assisted features into production behind content-safety and personal-data tests.
- Reworked the phone experience of the board in the iOS app (touch handling, pan and zoom, card opening) and improved the deployment workflow.

Creative Director

Jul 2025 – present

EPRIS Journal · independent journal of art, architecture and design, Milan and Kyiv

- Wrote 62 of the journal's 78 stories and 9 of its 10 reviews (as of November 2026).
- Stories on contemporary art, architecture and design: Cape Town's Zeitz MOCAA, Seville, Copenhagen's museums, the Bauhaus years, Antony Gormley, Tomás Saraceno, Pierre Huyghe and Mona Hatoum; the reviews cover restaurants and interiors where design is the experience.
- 17 long-form interviews with artists, architects, photographers and institutions, among them Museo Nivola, Federica Gioffredi, Nicolas Delarre and Stephen Spartana.
- Run interviews end to end: research, questionnaires in English and French, editing and approval by the interviewee.
- Co-edited the Autumn 2026 edition, *The Temperature of Time*: 52 pieces in six sections, a 230 × 300 mm print layout and an online reader.
- Conceived and curate the EPRIS Museum: 686 openly licensed works by 384 artists in 48 halls, each credited with its licence and collection.
- Built and run its platform: halls, works and artists kept as structured data and generated into a static site, with a private admin for exhibitions and publishing, on a Linux VPS under systemd; every publish pings IndexNow.
- Designed its REST API: scoped tokens (read, write, publish, payments), rate limits and an audit log. One idempotent request creates a whole exhibition (hall, images, wall dimensions, captions) and a repeat request updates it instead of duplicating it.
- Source works through the open-access APIs and IIIF image services of the Rijksmuseum, the Met and the Cleveland Museum of Art. Each work stores its own licence, credit line and source link, checked against the collection record before publication.
- Image pipeline: WebP variants and wall thumbnails generated on upload, with size limits and low-resolution warnings.
- Built the editorial system: publishing flow, translation into seven languages, picture research and rights clearance.

Founder and Product Lead

2024 – present

Munister Agency · independent digital product studio

- Lead discovery, product strategy, information architecture, UX and delivery for client and in-house products.
- Shipped and operate products in publishing, education, retail, ERP and civic services, including native iOS apps.
- Designed and built TaxTech, a training bank on a virtual token, together with TaxPay, its own payment page for external shops: the shop opens a signed session, the buyer confirms on the bank's hosted page, and the bank reports the result back to the shop and returns the buyer.

Heritage and Digital Art Practice

2024 – present

Independent research, writing and interactive works

- Visual atlases and documentary platforms where an archive becomes a route.

PROJECTS

TaxTech

web · iOS · 2026

A training digital bank on a virtual token. Flask API, a React web app and a native SwiftUI app for iPhone. Accounts, cards, transfers, deposits and credit run through a payment state machine with idempotency keys, authorization holds and a ledger. A fuzzy fraud engine applies 28 rules in three layers (the transaction, the sender's history, the transfer graph) and online payments are confirmed with a 3-D Secure code. Passkeys and Sign in with Apple. Receipts and statements are PDFs with a verification code derived by HMAC, a QR and a public page that checks them against record hashes. More than 150 automated backend tests.

TaxPay

payments · 2026

TaxTech's own payment page for external shops. The shop opens a session server to server, signed with HMAC-SHA256 and a timestamp inside a five-minute window. The buyer lands on a hosted page with the basket and the amount, signs in and pays in one tap. The bank then notifies the shop and returns the buyer, and the shop also checks the session status with a signed request in case the callback is lost. Sessions last 30 minutes, matching the shop's reservation of goods; refunds on cancelled orders go back through the bank and are idempotent.

EPRIS Journal app

iOS

Native reader for iPhone and iPad in Swift and SwiftUI: typeset articles, full-screen photography and offline reading; push notifications through APNs with deep links into articles; an editors' area with Sign in with Apple, a block editor, photo upload, drafts and scheduled publishing against the journal's API. Built to Apple's privacy requirements, with a privacy manifest and in-app account deletion that revokes the Apple tokens. On the App Store.

EPRIS Museum

web

A free online museum of public-domain and Creative Commons works. Halls, works and artists are kept as structured data and built into a static site; a REST publishing API with scoped tokens, rate limiting, an audit log and idempotent writes; imports from open-access collection APIs and IIIF services, with licence, credit line and source checked against the catalogue record; a WebP image pipeline; IndexNow notifications on every publication; an open call for living artists.

Architectura: Italy Drawn

iOS

An iOS atlas of measured drawings of Italian architecture with structured courses in English, Italian and Russian, built in SwiftUI. It works entirely offline: content and images are bundled with the app, with no account, no analytics and no network requests.

TeachED

web

A workspace for language teachers: lesson boards edited live over WebSockets, generated worksheets and classroom games, video as lesson material, and LLM-assisted features under automated content-safety and personal-data tests. REST API on Node.js and Express over PostgreSQL, Stripe billing, a native iOS client, automated backend tests and CI/CD.

Schemata

web · open source

An open-source relational modeller for Oracle that runs in the browser with no build step: a visual editor for tables, keys and relationships, DDL import and export, and an SQL sandbox for testing the schema.

SKILLS

Editorial: Long-form writing and interviewing, structural and line editing, fact-checking, issue planning, print production, picture research, Creative Commons and rights clearance.

Product: Discovery, strategy, information architecture, service design, UX direction, roadmaps, requirements, QA and launch.

Technical: Swift and SwiftUI, TypeScript, Node.js and Express, Python, SQL (PostgreSQL, SQLite, Oracle), React and Next.js, REST API design (scoped tokens, idempotent writes, rate limiting), WebSockets, Stripe, IIIF and museum open-access APIs, LLM integrations, Linux and systemd, Docker, CI/CD, automated testing.

Embedded and industrial: Embedded and real-time data acquisition systems, hardware for information collection, IoT and edge computing, industrial automation and control-system synthesis for Industry 4.0, information and measurement systems and the metrology of automated control systems, fuzzy-logic and neuro-fuzzy control, machine learning for process optimisation and environmental monitoring, computer vision for object localisation and identification.

Languages: Ukrainian (native), English (B1), German (B1), Polish (A2), Italian (A1).
